

Wire Harness

PCA produces a wide variety of harnesses for the Automotive, Trailer and Marine Industries. With years of experience in building harnesses, we are continually improving our processes and productivity, enabling our customers to stay competitive in today's fast paced business world. We have engineer and design processes that allow us to test a harness while it's being built. Our nylon braiding capabilities allow us to double braid ends and branches to prevent fraying, a feature not offered by standard purchased braiding. Convoluted tubing or tie wraps can also be used to maintain the shape of the harness. Our experienced and highly skilled engineering staff can work with you to develop the right harness.

Key Benefits

- High Quality
- Prototypes available
- Braiding provides more flexibility and durability in harsh environments

Applications

Rear-sill lighting for trailers, truck chassis, dashboard and panel wiring.
